

Weekly Task Report 3

Name	Abu Sufian Robin		
Week 3 Task Report			
Focus Area	Task Goals Complete	Completed Task Details	Corresponding Code Files
Data Handling With Python Libraries	☒ Work with python libraries ☒ Data Visualize and analysis ☒ Dataset Handling	In this project, I have found answers to various questions using data cleaning, target distribution and target parameters. For this, I have used the Python library seaborn to find heatmaps and distributions. And visualized it using the matplotlib library. I have used the pandas library to read the data file.	Heart_Disease_Prediction_Project
		For this project, I used various Python libraries such as pandas for loading and reading data, scikit-learn for cleaning data, fixing mismatch errors, seaborn for normalization, and matplotlib library for data distribution and data visualization. I also called various methods including encode(), median().	Life_Expectancy_Dataset_Analysis

Project Details

Heart Disease Project

In this project, I have used the heart disease dataset to find answers to various questions and visualized the data for some tasks. Among men and women, who have more heart disease, what age group of people is more likely to get heart disease and what type of chest pain will cause 1 person to get heart disease, I have found these. So I have saved the graphical outputs in a folder in the project. Through all these factors like blood pressure, blood sugar, electrocardiography results, I have identified people suffering from heart disease and found their distribution.

Life Expectancy Dataset Analysis

In this project, I did various analyses on people's life expectancy, such as finding answers to questions like HIV, blood pressure, how many people go to school, and how many people have diphtheria in the dataset. So I had to do data cleaning, normalization, missing value treatments, duplicate value removal, etc. And I have put the figures of outlier and distribution results in a folder.
